telnet_server

The screenshot shows a WSL terminal window titled "Network Programming (WSL: Ubuntu-20.04)". The left pane shows the execution of the `telnet_server` script, which starts a Multiprocessing Server listening on port 8880. A new client connects (PID: 9068), and the server executes `ls -a`. The right pane shows the execution of the `nc` command to connect to localhost:8880. The user is prompted for a password and enters "admin". The server responds with "Sai tài khoản. Nhập lại:" (Wrong username. Enter again:). The user enters "admin" again, and the server responds with "Đang nhập thành công. Nhập lệnh:" (Login successful. Enter command:). The user enters `ls -a`, and the server lists the contents of the current directory, including files like `client.txt`, `databases.txt`, `demo_addrinfo.c`, `demo_socket`, `demo_socket.c`, `hello.txt`, `http_server`, `http_server.c`, `out_9101.txt`, `server_email`, `server_email.c`, `sv_client`, `sv_client.c`, `sv_log.txt`, `sv_server.c`, `t`, `tcp_client`, `tcp_client.c`, `tcp_server`, `tcp_server.c`, `telnet_server`, `telnet_server.c`, `udp_chat`, and `udp_chat.c`. The user enters `Done.`, and the connection ends.

http_server

The screenshot shows a WSL terminal window titled "Network Programming (WSL: Ubuntu-20.04)". The left pane shows the execution of the `http_server` script, which starts a Preforking HTTP Server on port 8880 with 5 processes. A GET request is received from localhost:8880, and the server responds with a 200 OK status. The right pane shows the execution of the `curl` command to connect to http://localhost:8880. The output shows the HTML response, including the body and headers.

Time_server

The screenshot shows a Visual Studio Code editor with a terminal window open. The terminal is divided into two panes. The left pane shows the output of a command executed in a WSL (Windows Subsystem for Linux) environment. The right pane shows the output of a netcat (nc) listener on localhost 8888.

```
